

## Language Map for JavaScript

<p><b>Variable Declaration</b></p> <p><i>Is this language strongly typed or dynamically typed? Provide at least three examples (with different data types or keywords) of how variables are declared in this language.</i></p>	<p>JavaScript is a dynamically-typed language. You can declare variables, functions, and objects without specifying a type first.</p> <ol style="list-style-type: none"> <li>1. <code>var x = 5;</code></li> <li>2. <code>let x =5;</code></li> <li>3. <code>x = 5;</code></li> </ol>	
<p><b>Data Types</b></p> <p><i>List all of the data types (and ranges) supported by this language.</i></p>	<ol style="list-style-type: none"> <li>1. <b>number</b> - JS only has one type of number. Can be written with OR without decimals.</li> <li>2. <b>bigint</b> - can safely represent large numbers above 9007199254740991, CANNOT have decimals, arithmetic between BigInt and Number is not allowed, add <i>n</i> to end of a number to turn into a BigInt.</li> <li>3. <b>string</b> - you can use with single or double quotes.</li> <li>4. <b>boolean</b> -true or false.</li> <li>5. <b>null</b> - an object within JS that has no value – considered a bug NOT a feature.</li> <li>6. <b>undefined</b> – variable without a value.</li> <li>7. <b>symbol</b> - object whose constructor returns a symbol primitive that is guaranteed to be unique. Allows you to associate a unique, hidden symbol within the object data to aid with debugging.</li> <li>8. <b>object</b> - written with curly braces {}, properties are written as <i>name:value pairs</i>, separated by commas.</li> </ol>	
<p><b>Selection Structures</b></p> <p><i>Provide examples of all selection structures supported by this language (if, if else, etc.) Don't just list them, show code samples of how each would look in a real program.</i></p>	<p>if</p>	<pre>var number = 44; if ((number % 2) != 0 {     document.write(number + " is an odd number"); }</pre>
	<p>if else</p>	<pre>var number = 44; if ((number % 2) !=0) {     document.write(number + " is an odd number"); } else {     document.write(number + " is an even number"); }</pre>
	<p>switch</p>	<pre>var letter = "I"; switch(letter) {     default: document.write("consonant");     break;</pre>

		<pre> case "A": document.write("A is a vowel");     break; case "E": document.write("E is a vowel");     break; case "I": document.write("I is a vowel");     break; case "O": document.write("O is a vowel");     break; case "U": document.write("U is a vowel");     break; } </pre>
<b>Repetition Structures</b> <i>Provide examples of all repetition structures supported by this language (loops, etc.) <b>Don't just list them, show code samples of how each would look in a real program.</b></i>	for	<pre> for (let i = 0; i &lt; 5; i++) {     text += "The number is " + i +     "&lt;br&gt;"; } </pre>
	for/in	<pre> const person = {fname: "John", lname: "Doe", age: 25};  let text = ""; for (let x in person) {     text += person[x]; } </pre>
	for/of	<pre> const cars = ["BMW", "Volvo", "Mini"];  let text = ""; </pre>

		<pre>for (let x of cars) {   text += x; }</pre>
	while	<pre>while (i &lt; 10) {   text += "The number is " + i;   i++; }</pre>
	do/while	<pre>do {   text += "The number is " + i;   i++; } while (i &lt; 10);</pre>
<b>Arrays</b> <i>If this language supports arrays, provide at least two examples of creating an array with a primitive or String data types (e.g. float, int, String, etc.)</i>	<pre>let arr = new Array(); let arr = [];</pre>	
<b>Data Structures</b> <i>If this language provides a standard set of data structures, provide a list of the data structures and their Big-Oh complexity.</i>	<ol style="list-style-type: none"> <li>1. <b>Arrays</b> – collection of items stored at contiguous memory locations.</li> <li>2. <b>Objects (hash tables)</b> – collection of key-value pairs.</li> <li>3. <b>Stacks</b> – store information in list form (LIFO).</li> <li>4. <b>Queues</b> – stores information similarly to a stack but instead follows FIFO.</li> <li>5. <b>Linked lists</b> – stores information in a list but every value is linked to another. <ul style="list-style-type: none"> <li>• <b>Singly linked lists</b> – only contains pointer to next node.</li> <li>• <b>Doubly linked lists</b> – contains pointer to next node AND previous.</li> </ul> </li> <li>6. <b>Trees</b> – stores information by linking nodes in a parent/child relationship. <ul style="list-style-type: none"> <li>• <b>Binary trees</b> – each node has a maximum of two children.</li> </ul> </li> <li>7. <b>Heaps</b> – stores information similarly to a tree but varies on the two following types. <ul style="list-style-type: none"> <li>• <b>MaxHeaps</b> – parent nodes are always greater than its children.</li> <li>• <b>MinHeaps</b> – parent nodes are always smaller than its children.</li> </ul> </li> <li>8. <b>Graphs</b> – stores information by grouping nodes together and placing certain connections between them. Do not have roots, leaf nodes, head, or tail. No implicit parent-child relationship between nodes. <ul style="list-style-type: none"> <li>• <b>Undirected graphs</b> – no implicit direction in the connections between nodes (bidirectional). <math>A \leftrightarrow B \leftrightarrow C \leftrightarrow D</math></li> <li>• <b>Directed graphs</b> – implied direction between node connections (unidirectional). <math>A \rightarrow B \rightarrow C \rightarrow D</math></li> <li>• <b>Weighted graph</b> – connections between nodes have an assigned value (weight). It is information about the connection itself, NOT the nodes.</li> <li>• <b>Unweighted graphs</b> – connections between nodes have NO assigned value (weight).</li> </ul> </li> </ol>	

<b>Objects</b> <i>If this language support object-orientation, provide an example of how you would write a simple object with a default constructor and then how you would instantiate it.</i>	<pre>const person = {firstName:"John", lastName:"Doe", age:50; eyeColor:"blue"};</pre>
<b>Runtime Environment</b> <i>What runtime environment does this language compile to? For example, Java compiles to the Java Virtual Machine. Do other languages also compile to this runtime?</i>	<ol style="list-style-type: none"> <li>1. <b>Browser Runtime Environment</b> – where your JS application is executed within a browser, and it uses the methods built in to the browser to perform its desired actions.</li> <li>2. <b>Node Runtime Environment</b> – allows your JS application to be executed without a browser. <ul style="list-style-type: none"> <li>• CoffeeScript, Dart, TypeScript, Clojure Script</li> </ul> </li> </ol>
<b>Libraries/Frameworks</b> <i>What are the popular libraries or frameworks used by programmers for this language? List at least three (3) and describe what they are used for..</i>	<ol style="list-style-type: none"> <li>1. <b>React JS</b> – most popular framework (over 40% of devs use it), used to build highly-responsive user interfaces. Declarative, component-based (can reuse components to create complex UIs).</li> <li>2. <b>jQuery</b> – simplifies interaction with the DOM (Document Object Model) tree and helps with tree navigation.</li> <li>3. <b>Express</b> – typically used for backend development. Can be used with Node.js runtime. Provides an easy way to manage routing, middleware packages, and integrate plugins on server-side code.</li> </ol>
<b>Domains</b> <i>What industries or domains use this programming language? Provide specific examples of companies that use this language and what they use it for. <b>E.g. Company X uses C# for its line of business applications.</b></i>	<p><b>JS is most often used for client-side and server-side web development, mobile development, game development, front-end development, and back-end development.</b></p> <ul style="list-style-type: none"> <li>• <b>eBay</b> – uses JS for front-end and back-end development of their e-commerce website.</li> <li>• <b>Microsoft</b> – front-end &amp; back-end development for their web browser, Edge.</li> <li>• <b>Netflix</b> - front-end, back-end, and web-based development of their media streaming apps.</li> </ul>
